

FaxCore SharePoint Connector

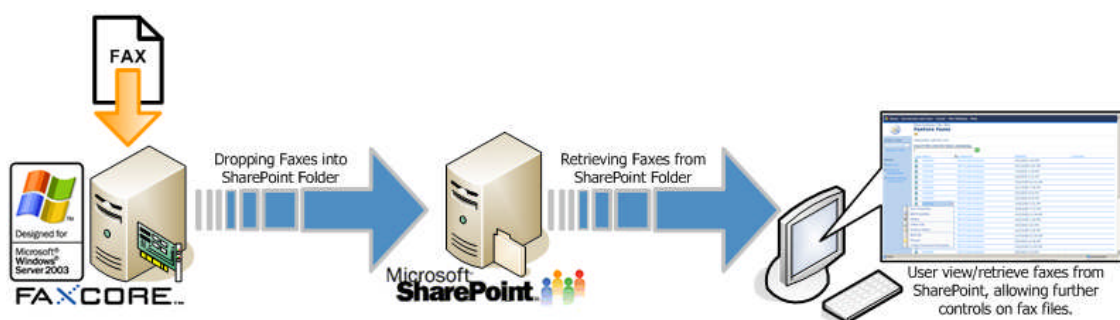

Overview

Microsoft's SharePoint® Portal Server 2003 is a powerful solution that provides a single point of access to people, teams, knowledge, and applications. Our connector has extended the value of SharePoint even further by indexing faxed documents and making them searchable. Prior to this integration faxes were just images that could only be read by people.

FaxCore's SharePoint Connector can also deliver faxes into designated SharePoint Document Libraries, making Purchase Orders, Sales Invoices, contracts, resumes and other business related documents easily accessible by the appropriate personnel. Now, the manual processes of scanning and filing faxes into SharePoint can be totally eliminated.

Benefits

- **Better security and access control.** Administrators can configure document libraries to only allow specific users to view, edit, download, or delete faxes from each folder. Adding on to this, each time a user modifies a fax within Share Point, an audit trail is created and compliance with various regulatory requirements is assured.
- **Collaborate and keep an audit trail on received faxes.** When a fax image needs to be annotated or edited, SharePoint can keep multiple versions of the fax image while maintaining the integrity of the original fax document. Now users can track changes and identify who made the changes.
- **Users will be able to perform full text searches on all faxes.** The FaxCore SharePoint Connector leverages the Optical Character Recognition (OCR) process within SharePoint, enabling users to perform text based searches on the content of the fax Images and to index the content of the fax images. This feature requires Microsoft SQL to be running with SharePoint.

System Requirements:

Microsoft SharePoint Portal 2003/ Windows SharePoint Services 2.0
Windows Server 2003
FaxCore Standard/Enterprise Server 4370
